Individual Contribution Statement on TradeSentinel

Team013 (Individual) · Jodhdeep Singh · 2025mb26112 · MBA – AI in Business · Management of AI Products · November 2026

Team013 is an individual submission, as stated on the proposal. I held every role below. As product manager, I set the problem, strategy and controls, briefed an AI coding and drafting assistant (Claude Code) on each piece of work, reviewed what came back, and decided what stayed.

1. Who Led Each Artifact

Role (packet Section 13)	Artifact	My contribution	AI assistant contribution
Product strategy lead	Proposal; topic, wedge, trust ladder, guardrails, payoff matrix, gates	Authored (October 2026)	Microsoft Copilot: light help with wording only
Product strategy lead	Strategy section; recommendation	Set the direction in the proposal; chose "pilot, shadow only" after reviewing the test results	Expanded the proposal into the report sections
PM artifacts / PRD lead	PRD, prioritization, roadmap, KPIs	Scope, non-goals, never-allowed list and gates from my proposal; reviewed the drafts	First drafts and the RICE arithmetic
UX and workflow lead	Wireframes, flow, trust design	Rejected the first crowded console; specified two lanes by who acts next, plain wording, the SME role and editable replies	Wireframes and interface code to my briefs
Data / evaluation lead	Synthetic data, evaluation	Accepted the evaluation approach; its limits are disclosed in the report	Wrote the synthetic data and the test harness, and ran it
Prototype / build lead	Web prototype and hosting	Product requirements, review in demos, and the decision to host it publicly on GitHub	Code, test scripts and the GitHub Pages set-up
Business / risk lead	Economics; risk note	Payoff values and the escalate-only principle from my proposal	Scenario calculations and the first risk register draft

2. Decisions I Kept (not outsourced to AI, per the packet)

Decision	My position	Reasoning
Opportunity choice	TradeSentinel, on the order-entry and execution flow	Repeated decision, measurable cost, and the highest cost of error, so the controls are tested where they matter
Risk acceptance	Missing a critical issue is unacceptable; needless escalations are accepted up to a ceiling that protects SME capacity	One missed critical issue costs about as much as 333 needless escalations, but an overloaded SME stops checking carefully
Launch recommendation	Pilot, shadow mode only; do not scale	Gate 1 is only partly met: three critical issues were under-triaged, and time saved is unmeasured
Monetization judgment	Internal funding for the pilot; a SaaS offer for other brokers only if reuse is proven	Value must be proven for one firm first; the control logic depends on its SLAs
Governance claims	Controls and launch blockers in Section 7 of the report	No legal or regulatory claim is made; these must be confirmed with compliance in Phase 0

3. How Outputs Were Checked

- I reviewed the prototype in live demos before each release and asked for changes: the two-lane board, the SME role, fixes assigned to the development team, editable replies, plainer wording and a clearer README link.
- Every quoted metric comes from the evaluation output, run once on frozen settings, and the economics come from one calculation script.
- I re-ran node evaluate.js holdout myself, and the results matched the documents: 90% category accuracy, 97.6% critical recall and 96.8% top-3 cause.

Declaration. I take responsibility for this submission, including the AI-assisted parts, and I can explain and defend its reasoning. AI use is disclosed in 05_AI_Collaboration_Log.md. Name: Jodhdeep Singh Roll No.: 2025mb26112 Signature: Jodhdeep Singh Date: 11 November 2026
